

ABSTRACT

A remote control system using the Internet is disclosed. According to the remote control system, a user can connect with the computer in charge of control without inputting information required for the connection by clicking an object such as an icon, an avatar or a hyper-link produced on the web page so that the control computer can remotely control the user's computer. Accordingly, even general users who are not skilled in using the Internet can be easily provided with remote control service through the Internet. Furthermore, in the case where high level security is required, such as finance, administration, e-commerce and so on, the user is confirmed through two steps by telephone as well as the access password so that high level security can be guaranteed.
